ABSTRACT

Currently, one of the important tasks is the development of scientific activity in various fields, the publication of scientific results written by scientists, scientific researchers in prestigious scientific journals, increasing their scientific performance on international platforms (h-index). Based on this task, the results of scientific research carried out by scientists on international platforms are now published and their analysis processes are carried out effectively by international scientists.

KEYWORDS: magazines, scientific research

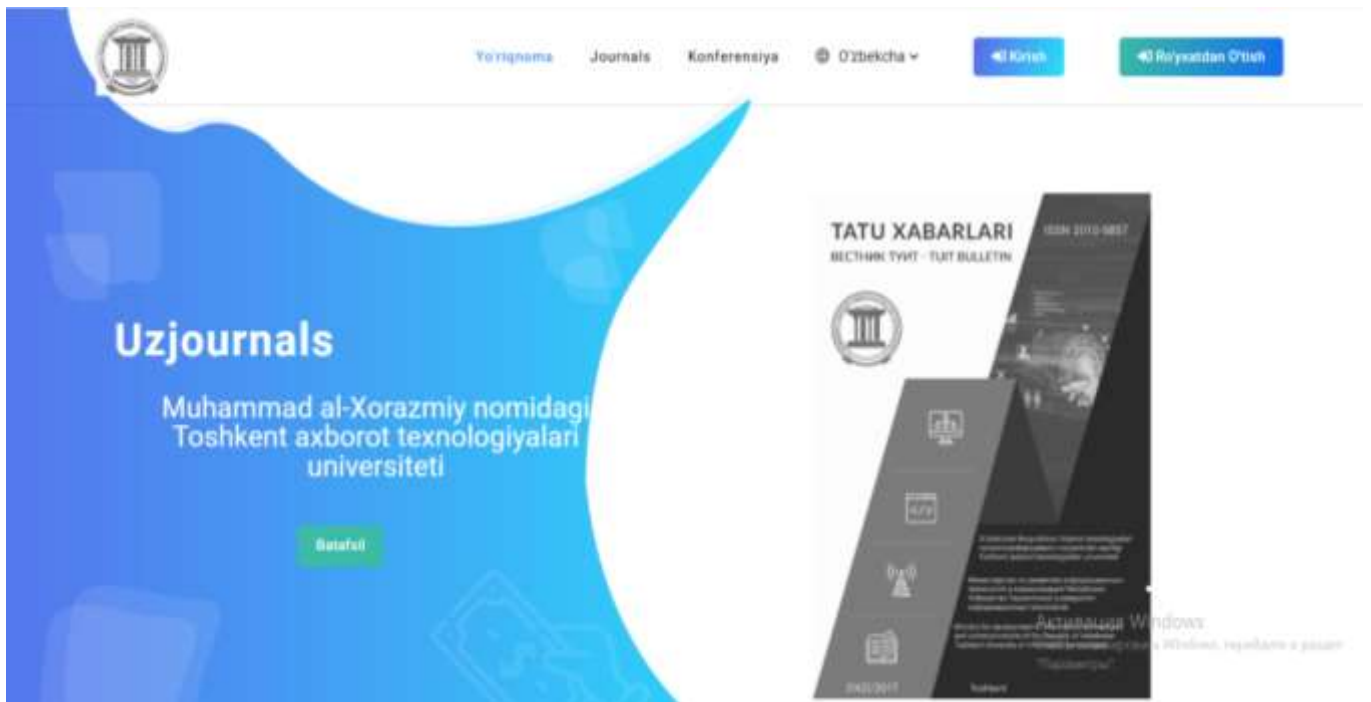

To date, a number of works by international scientists to identify h-index have been increased to amalg. B.A.Balatov, N.N.Kvelidze-Kuznetsova, V.V.Laptev and S.A. In the scientific research of morozovas on the determination of h-index, the proposed scientific metric indicator makes it possible to eliminate a number of shortcomings in the calculation of the number of quotations or the number of publications [1]. But this cited indicator has led to some problems when analyzed on the International Scopus and Web of Science platforms, that is, the article will only have to be in English and the scientific direction of the Journal being published will be given precisely.

E.A.Nazarenko and M.A. In the scientific work of the Nazarenko, research was also carried out to identify h-index in the journals of the Russian Federation (RINS) [2-3]. That is, in this article, the magazines that entered the RINS and their h-indexes are given.

J. E. Hirsch, Gualberto Buena-Casals ' articles entitled "The Meaning of the H-Index" generally provide information on the meaning of h-Index, why it is necessary and in what indicators it should be evaluated [4].

As can be seen from the analysis presented above, our Republic also has a number of problems on this task.

Today, there are also many reputable magazines in our republic, but we do not have a national platform that determines their h-Index by international standards. One of the important tasks today is to create a national platform for identifying the h-index of authoritative journals in the Republic of Uzbekistan by international standards, based on the analysis of scientific articles published by our scientists, to determine the number of links to the scientific periodicals they arbitrate, as well as the effectiveness of their contribution to science.

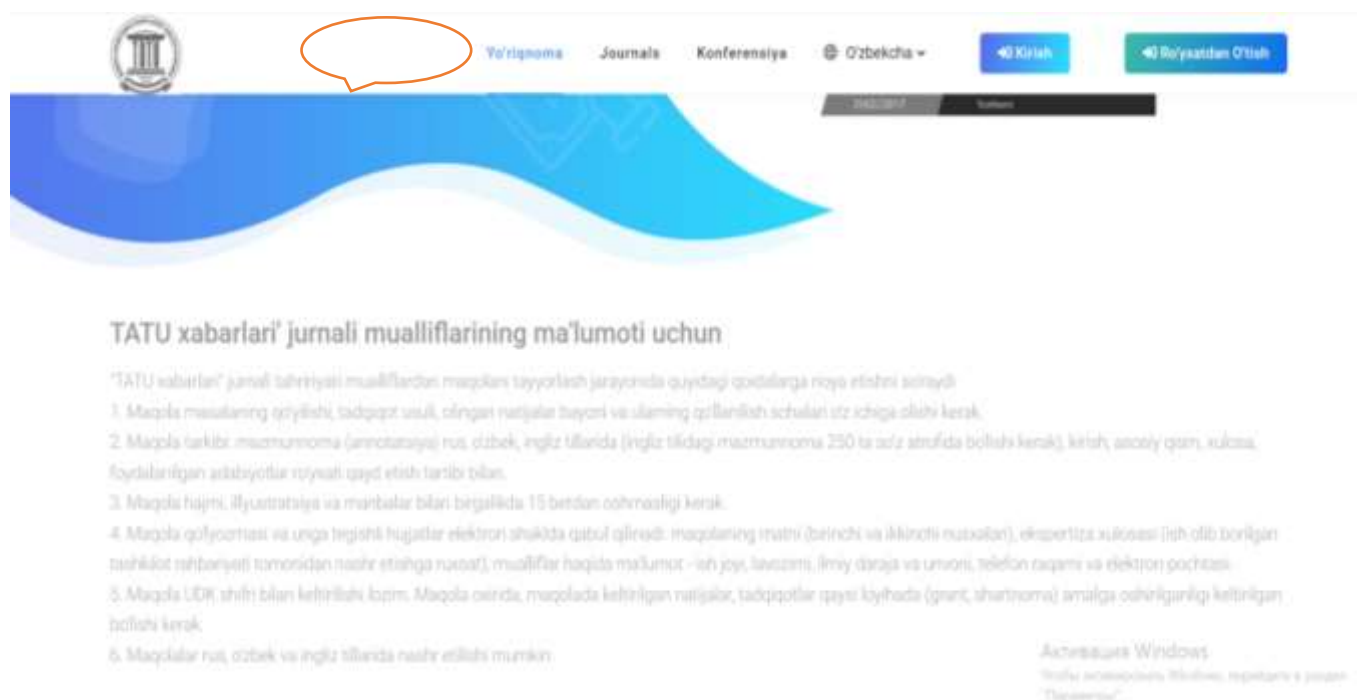

Main window (router, Journals, conference, entrance, registration).

For this platform to be created, the Web was first built of Design in which basically 4 types of colors were selected, making this web site look beautiful the entire site height used only these colors (#5478ed#29d3fb; #3bbca7; #000000).

The front-end part of the site is built in HTML5, CSS3, BOOTSTRAP5, JavaScript, with the aim of making the web site look more perfect CSS3's {background-image: linear-gradient(to right, (#5478ed, #29D3FB);} and this gives the inkony of switching from one color to the second color when the cursor is moved and animations are added Give is and this is known class: hover{ background-image: linear-gradient(to right, (#29d3fb, #5478ed);} and in order to avoid downloading an image in the current HTML5 technology of image laying <object data="rasm_nomi.jpg"></object > orientation filter to give style to the image itself as placed: none | blur() | brightness() | contrast() | drop-shadow() | grayscale() | hue-rotate() | invert() | opacity() | saturate () | sepia() / url ();

It is precisely in the animation that we can see the img filter style .animait{animation: animait 8s infinite;filter: contrast(1);}

```
@keyframes animait{
  0% {filter: contrast(1);}
  20% {filter: contrast(2);}
  40% {filter: blur(2);}
  60% { filter: grayscale(2);}
  80% { filter:brightness(1)}
  100% {filter:sepia(3)} }
```

We press the specified button to go to the router section.

If you have given attention you have not noticed a change in the part of the Navbar and have updated the other sections without updating the navbar it is a dynamic site construction and this is the power of the PHP programming language.

In php, the site has 4 variable sections .php was used by calling it out to file `<?php include "./header.php"; ?>` `<?php include "./main.php"; ?>` `<?php include "./contact.php"; ?>` `<?php include "./faater.php"; ?>` and in order for the site to be responsive, go'ny was useful from BOOTSTRAP 4 and 5 versions in order to provide flexibility to all devices
